Integrating a Zoho Creator application with another Zoho service using connections and APIs

Sustainability Complaints — Zoho CRM Integration (Smart Campus Sustainability & Carbon Tracker)

Kanishka S | *240701227*

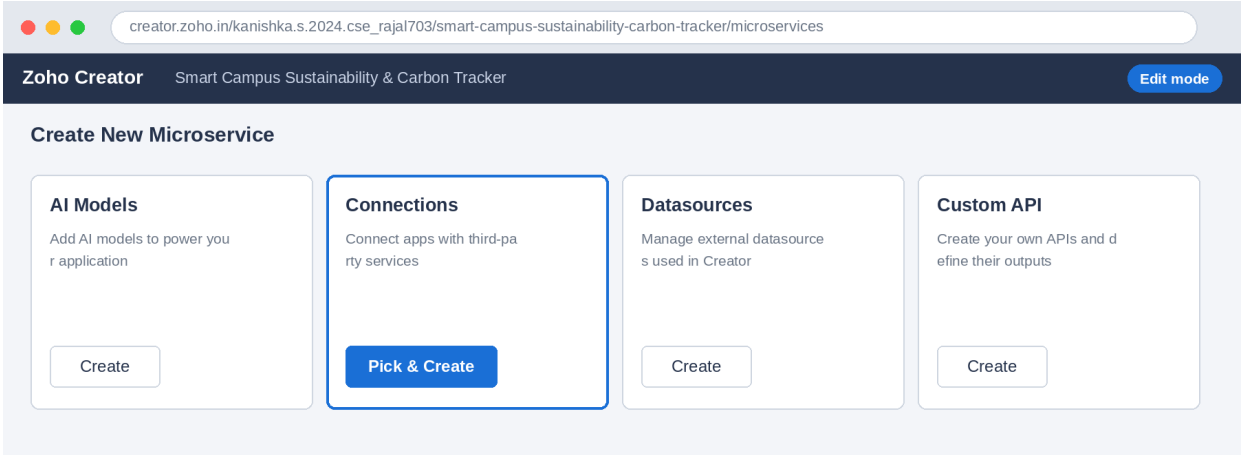

1. Aim

To integrate the Sustainability_Complaints form of the Smart Campus Sustainability & Carbon Tracker application with Zoho CRM using a microservice connection, a conditional workflow and Deluge scripting, so that every new complaint is forwarded automatically to the institution's CRM as a Contact record.

2. Procedure

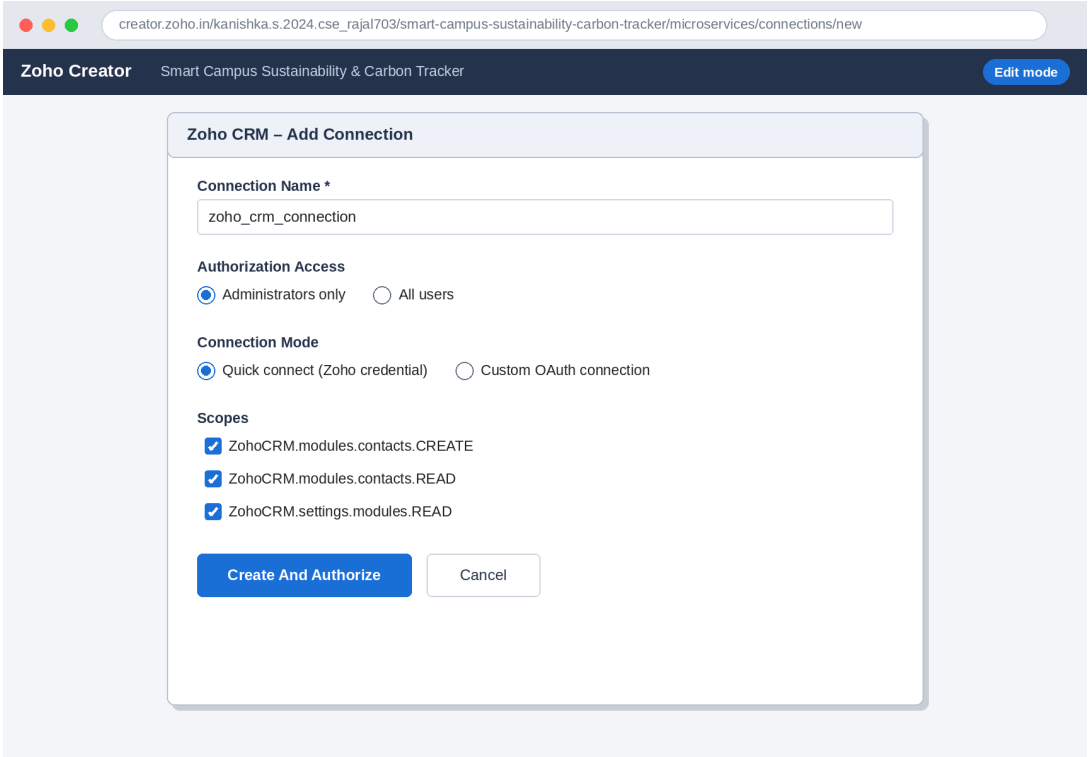

Phase A: Navigating to the Connection Panel

1. Log in to the Zoho Creator account and open the application Smart Campus Sustainability & Carbon Tracker.
2. In the left navigation panel under the Develop section, click Microservices to access the integration environment.
3. Review the available options and choose Connections (Pick & Create) to configure the Zoho CRM service bridge.

The Create New Microservice panel lists AI Models, Connections, Datasources and Custom API; the Connections option is chosen using Pick & Create (illustration).

4. In the Zoho CRM – Add Connection dialog, enter the connection name **zoho_crm_connection**, set Authorization Access to Administrators only, choose Quick connect (Zoho credential), select the contact scopes and click Create And Authorize.

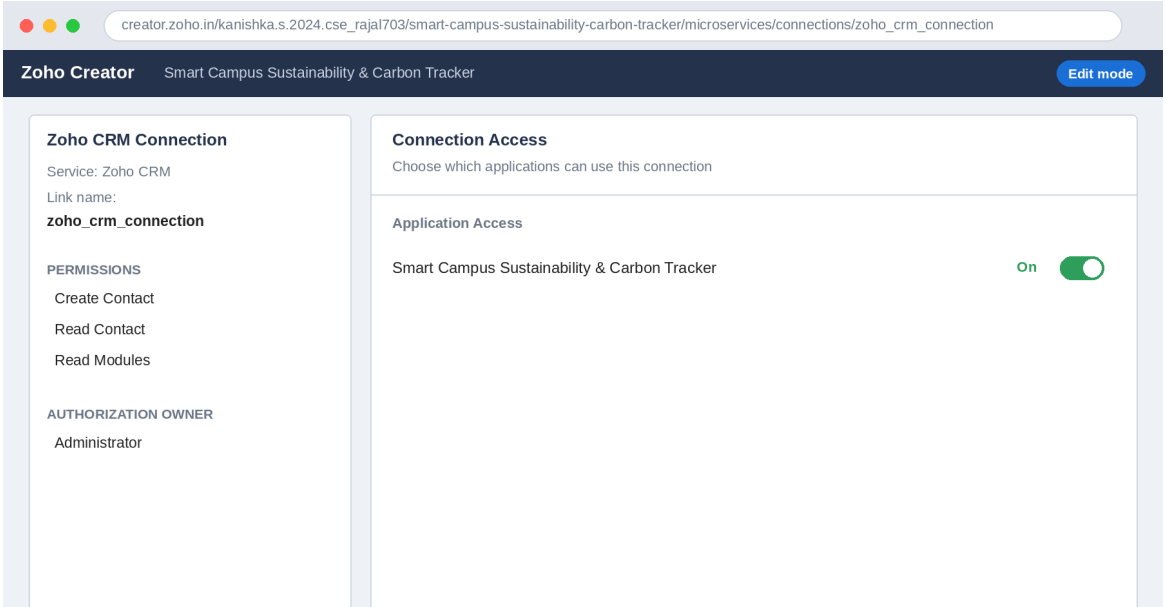

The Zoho CRM – Add Connection dialog with the connection name zoho_crm_connection, Authorization Access set to Administrators only and Quick connect mode, followed by Create And Authorize (illustration).

Phase B: Verifying Scopes and Application References

5. Click the Zoho CRM connection to open its permissions and access settings.

6. In the left panel, inspect the permissions (Create Contact, Read Contact, Read Modules) to confirm the API access that was granted.

7. In the main pane, verify that the application Smart Campus Sustainability & Carbon Tracker is switched On under Connection Access.

The Zoho CRM Connection panel showing the link name zoho_crm_connection, the granted permissions, the authorization owner (Administrator) and the application toggle set to On (illustration).

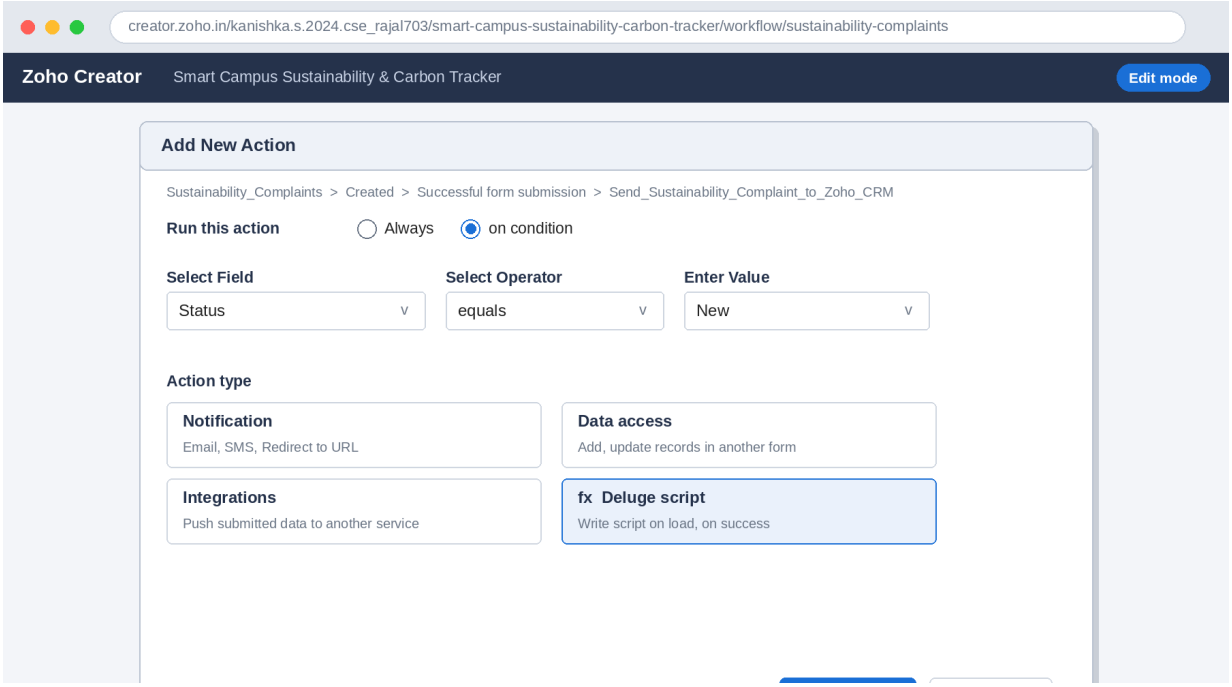

Phase C: Setting Up Conditional Rules

8. Navigate back to the application, select the Sustainability_Complaints form and open the Workflow tab.

9. Create a form workflow named Send_Sustainability_Complaint_to_Zoho_CRM that executes on Created > Successful form submission.

10. Inside the action builder, switch the run parameter from Always to on condition.

11. In the condition builder choose the field Status, the operator equals, and the value New, so that only newly raised complaints are forwarded.

The Add New Action panel with Run this action set to on condition, Status equals New, and the available action types (illustration).

Phase D: Compiling the Deluge Script Code

12. Select Deluge script (fx) from the action types to open the embedded Deluge editor.

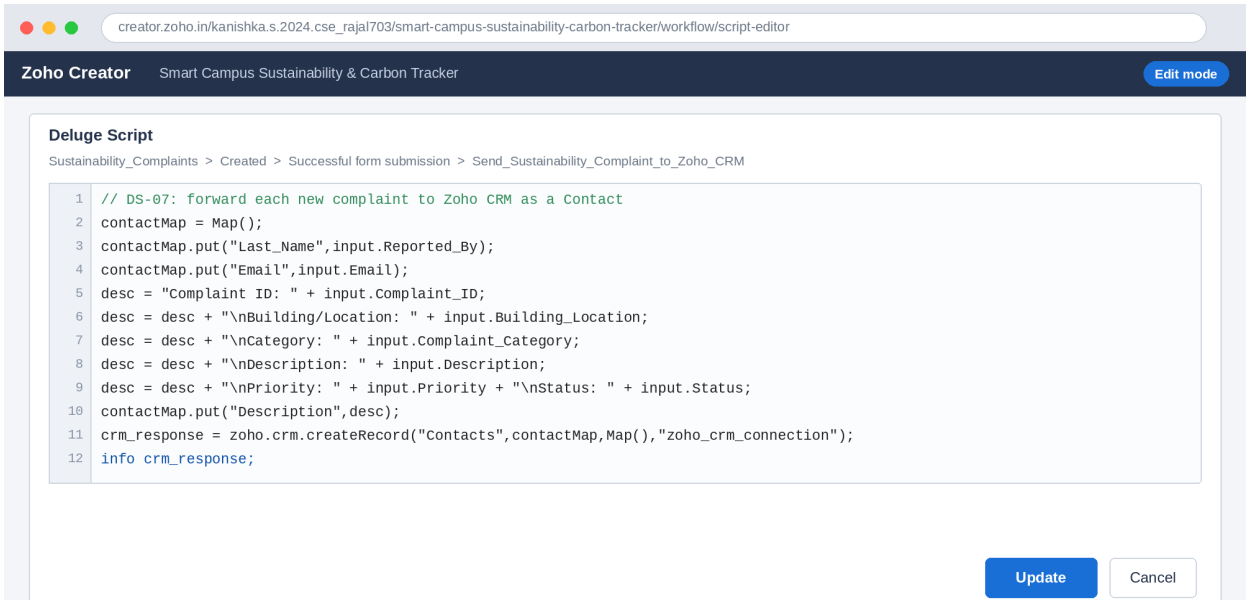

13. Build a map of the contact details using the field tokens input.Reported_By, input.Email, input.Complaint_ID, input.Building_Location, input.Complaint_Category, input.Description, input.Priority and input.Status.

14. Call zoho.crm.createRecord for the Contacts module and reference the connection link name zoho_crm_connection.

15. Click Update to run the compiler validation and save the script.

```
// DS-07: forward each new complaint to Zoho CRM as a Contact
contactMap = Map();
contactMap.put("Last_Name",input.Reported_By);
contactMap.put("Email",input.Email);
desc = "Complaint ID: " + input.Complaint_ID;
desc = desc + "\nBuilding/Location: " + input.Building_Location;
desc = desc + "\nCategory: " + input.Complaint_Category;
desc = desc + "\nDescription: " + input.Description;
desc = desc + "\nPriority: " + input.Priority + "\nStatus: " + input.Status;
contactMap.put("Description",desc);
crm_response = zoho.crm.createRecord("Contacts",contactMap,Map(),"zoho_crm_connection");
info crm_response;
```

Code 7.1 — Send_Sustainability_Complaint_to_Zoho_CRM (DS-07)

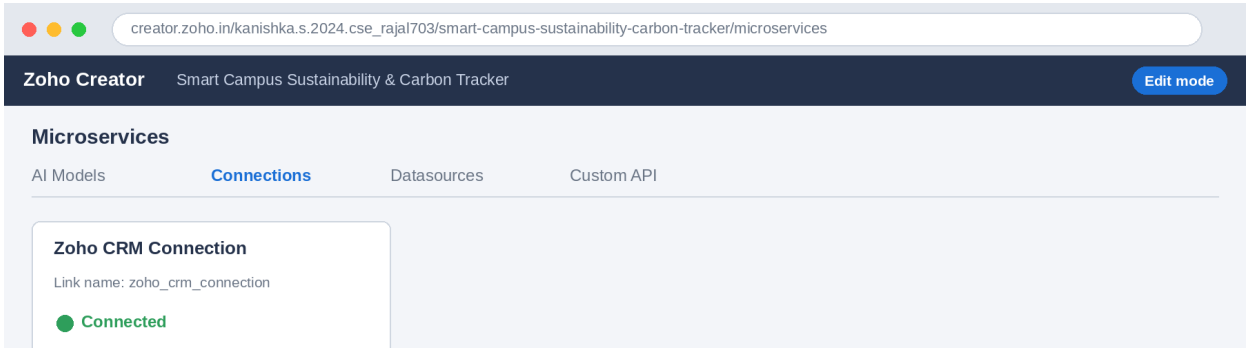

The Deluge editor for the CRM workflow: the script builds the contact map, calls createRecord through the connection and traces the response with info (illustration).

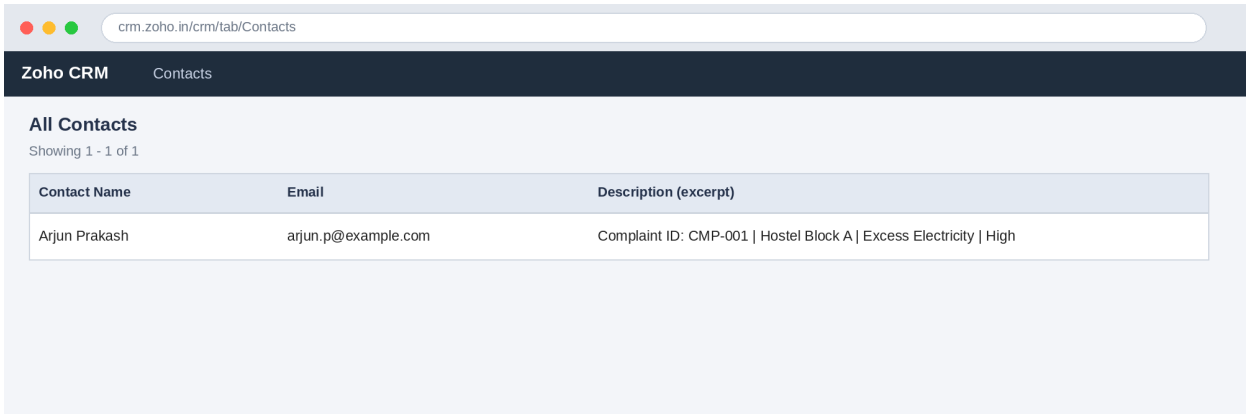

3. Output & System Verification

The integration was tested by submitting a sample complaint (Complaint ID CMP-001, reported by Arjun Prakash, category Excess Electricity, priority High, status New). The Zoho CRM Contacts module then showed a new contact whose description carries the complaint details.

- **Connection diagnostic result:** Connected.
- **Operational availability:** the connection link name zoho_crm_connection is active and usable from the workflow.
- **Workflow status:** Send_Sustainability_Complaint_to_Zoho_CRM was saved without compilation errors and is mapped to Sustainability_Complaints (Created > Successful form submission).

4. Conclusion

The experiment demonstrates how a low-code application can be connected to another Zoho service using a microservice connection, a conditional workflow and Deluge scripting. By binding the Sustainability_Complaints form to the zoho_crm_connection, every newly raised complaint becomes a CRM contact automatically, giving the institution a single customer-relationship record of who reported which sustainability problem, where, and with what priority.
